REASONS FOR ALLOWANCE

The instant invention is deemed to be directed to an unobvious improvement over the invention patented in U. S. Patent Nos. 4,979,878 to Short et al. and 3,703,848 to Brown, 4th. Short et al. discloses a piston sized to be received in a cylinder, the piston includes an intermediate section, a connecting rod extending away from the intermediate section to engage a crank shaft, the intermediate section has a diameter that creates a fluid seal against the corresponding cylinder during a power stroke of the piston, including exhaust vents positioned to temporarily open the fluid seal during an exhaust stroke of the piston, and further including a connecting rod extending away from the section to engage a crank shaft.

The improvement comprises an actuator extending away from the intermediate section to cyclically engage a valve to allow compressed fluid into the cylinder during a power stroke of the piston, the intermediate section having an annular groove and a seal positioned in the groove to creates a fluid tight seal with the cylinder during the power stroke for the purposes of providing a simple and efficient pneumatic motor without the need for valve rods.

Brown, 4th teaches for a piston received in a corresponding cylinder and a connecting rod engaging a crank shaft and that there is an actuator extending away from the piston that has means to allow compressed fluid into the cylinder. Since the piston of Short et al. wobbles and teaches away from using an actuator extending away from the section, there is no motivation to combine Short et al. and Brown, 4th. See Short et al. col. 1 lines 20-62.
